The problem:
In a neighbourhood there could be bakesale, lemonade stands, and people willing to give away excess harvest from their veggie garden. There isn't a way to know this unless you scroll through craigslist or facebook marketplace and sift through items and maybe you will find a hit.

[ PLACEHOLDER ] is an application that will allow users to sell and advertise their bake sales, lemonade stalls and other home made goods (meals, produce) to other users. A location will display  any listings in the area, and how many miles away in the neighbourhood the sale is. Users can trust in each other's rating on the post/seller's profile. Sellers are encouraged to post pictures of their items to best represent what the item is and to write an accurate description to what the item is.

The app is strictly for food and vegetables. Payment is not done through this application, it shows the location the seller has listed.

Will be created using react or angular to create a site which will shrink down the layout to have a mobile view.
